

EXPERIMENT 5

Objective: Design a class to represent a bank account with proper data hiding and member functions for deposit and withdrawal operations.

```
#include <bits/stdc++.h>
using namespace std;

class bank_account {
private:
    int balance;
    int deposit;
    int withdraw;

public:
    void input_balance() {
        cout << "Enter initial balance: ";
        cin >> balance;

        if(balance < 0) {
            cout << "Balance cannot be negative!\n";
        }
        else {
            cout << "Initial balance: " << balance << endl;
        }
    }

    void dep() {
        cout << "Enter the amount you want to deposit: ";
        cin >> deposit;
        if(deposit < 0) {
            cout << "Deposit amount cannot be negative!\n";
        }
        else {
            balance += deposit;
            cout << "Current balance: " << balance << endl;
        }
    }
}
```

```

    }

    void with() {
        cout << "Enter the amount you want to withdraw: ";
        cin >> withdraw;

        if(withdraw < 0) {
            cout << "Withdrawal amount cannot be negative!\n";
        }
        else {
            if(withdraw > balance) {
                cout << "You don't have enough balance!\n";
            }
            else {
                balance -= withdraw;
            }
            cout << "Current balance: " << balance << endl;
        }
    }
};

int main() {
    bank_account A;
    A.input_balance();
    A.dep();
    A.with();
}

```

Output:

```

● PS C:\Second Year\3rd Semester\OOPS using C++ Lab> cd "c:\Sec
gram5 } ; if ($?) { .\Program5 }
Enter initial balance: 6000
Initial balance: 6000
Enter the amount you want to deposit: 3000
Current balance: 9000
Enter the amount you want to withdraw: 1500
Current balance: 7500
