

# EXPERIMENT 8

**Objective:** Write a program to pass objects as arguments and return objects from functions to perform operations on user-defined data.

```
#include <bits/stdc++.h>
using namespace std;
```

```
class student {
private:
    int roll;
    string name;
    int marks;
```

```
public:
    void get() {
        cout << "Name: ";
        cin >> name;

        cout << "Roll no.: ";
        cin >> roll;

        cout << "Marks: ";
        cin >> marks;
    }
```

```
student higherMarks(student s) {
    if(marks > s.marks) {
        return *this;
    }
    else if(marks < s.marks) {
        return s;
    }
}
```

```
void details() {
    cout << name << ", with roll no. " << roll << " has scored higher marks" << endl;
    cout << "Score: " << marks << endl;
}
```

```

};

int main() {
    student s1, s2, s3;

    cout << "Enter details of Student 1: \n";
    s1.get();

    cout << endl;

    cout << "Enter details of Student 2: \n";
    s2.get();

    s3 = s1.higherMarks(s2);
    s3.details();
}

```

## Output:

```

● PS C:\Second Year\3rd Semester\OOPS using C++ Lab> cd "c:\Second Year\
Program8.cpp -o Program8 } ; if ($?) { .\Program8 }
Enter details of Student 1:
Name: Satyansh
Roll no.: 101
Marks: 99

Enter details of Student 2:
Name: Saurabh
Roll no.: 102
Marks: 98
Satyansh, with roll no. 101 has scored higher marks
Score: 99
○ PS C:\Second Year\3rd Semester\OOPS using C++ Lab>

```
